film rolls for metal printing

<http://flaxart.com/2013/03/chromaroll-inkjet-printing-on-metal/> -- Chromaroll is an aluminum printing film for inkjet printers that is new to the US market for 2013. Utilizing cutting edge technology to produce a micro-thin metal surface that has a mirror finish, your digital prints can now possess an iridescent quality, more punch and vibrancy, than is available with other media.

Chromaroll is produced through a process known as "vacuum metallization", where a very thin sheet of polypropylene is coated with a layer of aluminum. The metal surface is then treated to accept standard (pigment based) ink from a wide variety of home or office inkjet printers, providing an exciting new way to print unique photographs and fine art giclées.
